

Mastitis is costly—and it doesn't have to be that way

Every 100,000 cells/ml BSCC is above 100,000 there will be a 1-3% decrease in milk production

The true cost of every clinical case is \$200.

Here at VetSouth we have the solutions.

- Laboratory to culture milk samples and determine the bacterial cause

This tells us:

- which control measures to focus on
- which treatments are most likely to be effective

- Computer Programmes (MINDA and Infovet)

These help us:

- analyse patterns of disease (old vs young, time of year, retreatment rate) monitor BSCC and treatment rate as changes are made.

- Milking machine testing equipment Which gives us the ability to test:

- Vacuum levels in the cluster during milking
- Vacuum stability during milking
- Pulsation on cows that are milking

Staff training tailored to your farm and your problem. After a milking time visit it is possible to focus on milking technique and teat spraying issues that as they apply to your farm and cow shed.
